

POWERING THE FUTURE — TODAY

Your own charging platform – operated in Norway

Full control over charging, payment and energy – with a dedicated app for iPhone and Android.
Delivered pre-configured with every Grasen charger from Globe Energy.

ONE PLATFORM – YOUR ENTIRE SITE

What is the charging platform?

All Grasen chargers from Globe Energy come pre-configured with our own charging platform – operated on servers in Norway. The platform gives you full visibility and control of your entire charging site from a single dashboard, whether you run two AC points at a housing cooperative or a full depot of fast chargers for heavy vehicles.

1 Everything in one dashboard

Real-time status for every charge point, remote control and reports – from PC, tablet or phone.

2 A dedicated user app

Drivers and residents start, pay for and monitor charging in their own app for iPhone and Android.

3 Operated in Norway

The platform runs on leased server capacity in Norway – with Nordic support from Globe Energy.

SEE EVERYTHING – CONTROL EVERYTHING

Monitoring and remote control

1 Real-time monitoring

Status, power and availability for every charge point – with automatic fault alerts.

2 Remote control

Start, stop and restart charge points remotely – no site visit required.

3 Reports

Customisable reports on consumption, revenue and usage patterns – ready for your accounts.

4 Remote updates

Software and firmware are updated over the air – your chargers stay up to date.

Most faults are resolved remotely – Globe Energy Charge monitors and troubleshoots your site without a visit – 24/7.

EARN ON EVERY KWH

Payment, your way

1 Card reader on the charger

Grasen chargers ship with a card reader – payment directly at the charger, linked to your payment provider. Ready for AFIR.

2 Payment in the app

Cards and other payment methods right in the app – users are billed automatically after each session.

3 Flexible pricing models

Set your own prices per kWh, per hour or per session – with separate rates for reservation and idle time.

Automatic invoicing

Individual invoicing per user or tenant – the platform tracks who charged what and invoices automatically. Perfect for housing cooperatives, property owners and companies with fleet vehicles.

YOU DECIDE WHO CHARGES

User and access management

1 User groups with their own prices

Employees, residents, guests and public users can have different prices and discounts.

2 Private or public

Choose per charge point whether it is open to everyone or only to your own users.

3 Multiple sites – one login

Several properties or depots? All sites are managed from the same dashboard.

4 RFID and app access

Users identify with an RFID tag or the app – adding and removing users is simple.

For larger customers: manage your own sub-operators with their own pricing – ideal for property companies and chains.

LOWER ENERGY COSTS – AUTOMATICALLY

Energy management that pays off

1 Dynamic load balancing

The platform distributes available power between chargers so the main fuse is never overloaded – even when everyone charges.

2 Cut peak loads

Charging is managed smartly around the clock, keeping power peaks – and grid tariffs – down.
Combine with BESS if you like.

3 Full energy overview

See consumption per point, per user and per period – and document the savings in black and white.

For depot charging of heavy vehicles

Power management is essential when the whole fleet charges overnight – the platform prioritises vehicles by departure time and available capacity, so every vehicle is ready for its first run.

One partner – the complete solution

Grasen chargers with a 26-month warranty · Own charging platform operated in Norway · Own app
Installation and service by Globe Energy Charge AS · 24/7 on-call across the Nordics and Baltics
